

# Ditch Magnet

The Gotco Ditch Magnet is a junk retrieval tool designed to remove metal particles from drilling mud. High quality stainless steel is used to encapsulate a series of extra strength magnet elements assuring maximum pick-up capacity.

### Operation

The magnet should be used any time metal particles may accumulate in the mud. This is a required tool during milling and washover operations. Position the magnet in the mud return line

before the shale shaker. Metal particles passing by the magnet will then be caught and retained, protecting the shale shaker, mud pumps and other costly components of the mud system.
